

Sales Analysis Dashboard – Power BI

A Power BI report created to analyze yearly sales performance and identify growth patterns.

Project Overview

This project focuses on visualizing the **Sum of Sales by Year** using Power BI Desktop. The goal is to understand how sales have changed over time, identify increasing or decreasing trends, and present the results using an interactive dashboard.

Steps Followed in This Project

1. Data Collection

- Imported the raw dataset into **Power BI Desktop**.
- Ensured the data contained fields like **Sales**, **Order Date**, and other relevant attributes.

2. Data Cleaning & Transformation

- Converted *Order Date* into **Year** using Power BI's data modeling tools.
- Checked for:
 - Missing values
 - Incorrect data types
 - Formatting issues
- Cleaned and validated the dataset to ensure accurate reporting.

3. Data Modeling

- Created a structured model suitable for time-based analysis.
- Added a **Year column** for yearly aggregation of sales.

4. Visualization

- Designed a **column chart** to display:
 - Sum of Sales for each year from **2011 to 2014**.
- Added:
 - Labels
 - Legends
 - A clean and professional layout
- Ensured the dashboard gives a clear comparison of yearly sales.

5. Insights Generated

- Identified overall sales trends across 4 years.
- Highlighted **increases or decreases** in sales.
- Delivered a summary section showing total performance across the period.

Output:

The final dashboard visually represents:

- Sales for each year (2011–2014)
- Total sales
- Year-over-year **increase or decrease**

Tools Used

- **Power BI Desktop**
- **Data Modeling (DAX, Power Query)**
- **Data Visualization Techniques**

Conclusion

This project demonstrates how Power BI can be used to transform raw sales data into a clean, insightful dashboard. The visual representation helps businesses quickly understand sales patterns and make strategic decisions.
